SANDMASTER

HIGH PRESSURE WASHING UNIT

COMPACT CLEANING UNIT

Rain, wind, and other environmental influences deposit dirt particles and foreign matter within the open-pore structure of rubber flooring. When these pores become clogged, moss and algae can form, significantly reducing drainage performance. The result: the surface becomes slippery and cracks can form.

Our specially developed and patented cleaning unit, the HDR 200, shows its strength wherever space is tight. Thanks to its compact design, it reliably and thoroughly cleans even hard-to-reach areas. The HDR 200 effortlessly passes through narrow driveways and gates as tight as 1.10 m wide.

With a continuous water supply via a hose with C-coupling or a 3/4“ tap connection, the HDR 200 operates at a powerful water pressure of up to 200 bar. Its integrated wastewater extraction system removes contaminants right where they occur — efficiently and cleanly, with no mess left behind. Whether rubber or stone flooring: cleaning is carried out effectively and in a way that protects the material.

For stubborn stains and other discoloration, we offer a special cleaning solution that resolves even these issues.

Our high standard of quality is confirmed by RAL quality mark certification.

Compact. Clean. Reliable.

OUR SERVICES

- Removal of moss and algae
- Reduction of slip hazard
- Restoration of drainage performance
- Extended service life
- Cleaning with clear water, no chemicals
- Outstanding visual cleaning results
- Cleaning of rubber flooring
- Cleaning of stone and concrete surfaces
- Passes through access points as narrow as 110 cm
- Closed system with no environmental contamination
